INTRODUCTION

The medical staff is trained in a theoretical, mechanized manner, the role of behavioral sciences. However, conduct and communication are essential elements of medical practice, health professionals being guided by several ethical guidelines.

METHODS

We focused on researching works in the field of behavioral sciences, focusing on the method of observation.

OBJECTIVES

To demonstrate the fundamental importance of behavior in medical activity.

RESULTS

Just as a disease that's caused by an internal imbalance manifests itself through deviations from the medical norm, a good specialist is one who is aware that humans are an unitary bio-psycho-emotional system and tries to establish an empathic connection with the patient. The role of behavior in improving the patient's condition is based on the mind-body connection, the emotional background being a catalyst for biochemical reactions of the body. In an era dominated by stress induced diseases, it is necessary for a doctor to use various communication and conduct techniques to ensure the highest quality of the diagnosis and the treatment process.

CONCLUSIONS

As the emotional background catalyzes all the processes of the body, the training of behavioral sciences is indeed necessary, especially - the formation of communication skills in relation to the patient, in fact, the doctor's conduct is monitored according to pre-established protocols and laws.
